

Used Forklift Parts

Used Parts for Forklifts - Eventually, forklift parts will wear and have to be replaced. Acquiring brand new components can become a costly endeavor so one more idea is to purchase used forklift parts. This can save much money eventually. It is a good idea to acquire used forklift components that have been reproduced. These parts will ensure that you are getting parts that would work for a long time and be productive.

Remanufacturing worn out or broken components is a less expensive method in general compared to rebuilding. With rebuilding parts, only the parts that are broken or worn out get changed, which means that other wearable components can break down soon after acquisition.

Remanufacturing however offers the best assurance for used components. Remanufactured parts are taken apart and cleaned and then all wearable pieces are changed. All wearable components are replaced regardless of age or wear which is one more reason why remanufactured components on the whole run so much better. Whatever component within the part is brand new and this provides far longer life to the second-hand part. Based on the forklift parts that are being redone, the cleaning process and the complete remanufacturing process will vary.

The engines are cleaned after a complete disassembly. Different engine parts like for example pistons, spark plugs, rings, valves, valve springs, and filters can be replaced during the process of remanufacturing. The engines are hot tested after reassembly to ensure that there are no noise, no oil pressure problems, no leaks or any vacuum.

Transmissions are oven cleaned, pressure washed, and disassembled. A thorough examination is done to check for any cracks. Seals, bearings and bushings are all replaced. Usually, the replacement parts utilized on transmission parts meet OEM specifications.

Certain parts such as the water pump, torque converters, the alternator, the starter and steer axles can obtain longer serviceability after being remanufactured and having all wearable components replaced. The electronic control in the electric forklift is maintained by the control card. This card could also be reproduced with replacing all aged and worn out components. Unlike several forklift parts the control card could only have the worn and aged parts replaced.

Remanufactured components are meticulously checked upon reassembly to guarantee they are in top condition before being sold. It is vital when purchasing remanufactured parts to be certain they have undergone the proper testing and inspection procedures. On certain bigger parts such as engines, transmissions and steer axles, OEM specification replacement parts must be used.

The forklift dealer could ensure that the components they have reproduced meet the OEM specifications. This would even ensure the parts meet industry standards. Many details go into remanufacturing used components. This attention to detail provides more serviceability out of remanufactured parts than the parts that were merely rebuilt.
